Implement SGD Classifier with Logloss and L2 regularization Using SGD without using sklearn

There will be some functions that start with the word "grader" ex: grader_weights(), grader_sigmoid(), grader_logloss() etc, you should not change those function definition.

Every Grader function has to return True.

Importing packages

In [46]:
```
import numpy as np
import pandas as pd
from sklearn.datasets import make_classification
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
from sklearn import linear_model
```

Creating custom dataset

In [47]:
```
# please don't change random_state
X, y = make_classification(n_samples=50000, n_features=15, n_informative=10, n_redundant=5,
                           n_classes=2, weights=[0.7], class_sep=0.7, random_state=15)
# make_classification is used to create custom dataset
# Please check this link (https://scikit-learn.org/stable/modules/generated/sklearn.datasets.make_classificatio
```

In [48]:
```
X.shape, y.shape
```

Out[48]:
```
((50000, 15), (50000,))
```

Splitting data into train and test

In [49]:
```
#please don't change random state
# you need not standardize the data as it is already standardized
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.25, random_state=15)
```

In [50]:
```
X_train.shape, y_train.shape, X_test.shape, y_test.shape
```

Out[50]:
```
((37500, 15), (37500,), (12500, 15), (12500,))
```

SGD classifier

In [51]:
```
# alpha : float
# Constant that multiplies the regularization term.

# eta0 : double
# The initial learning rate for the ‘constant’, ‘invscaling’ or ‘adaptive’ schedules.

clf = linear_model.SGDClassifier(eta0=0.0001, alpha=0.0001, loss='log', random_state=15, penalty='l2', tol=1e-3
clf
# Please check this documentation (https://scikit-learn.org/stable/modules/generated/sklearn.linear_model.SGDCl
```

Out[51]:
```
SGDClassifier(eta0=0.0001, learning_rate='constant', loss='log',
              random_state=15, verbose=2)
```

In [52]:
```
clf.fit(X=X_train, y=y_train) # fitting our model
```

```
-- Epoch 1

         0.19705191,  0.00421916, -0.0796037 ,  0.33852802,  0.02266721]]),
 (1, 15),
 array([-0.8531383]))
```

Implement Logistic Regression with L2 regularization Using SGD: without using sklearn

1. We will be giving you some functions, please write code in that functions only.
2. After every function, we will be giving you expected output, please make sure that you get that output.

- Initialize the weight_vector and intercept term to zeros (Write your code in def initialize_weights())
- Create a loss function (Write your code in def logloss())

  $logloss = -1 * \frac{1}{n}\Sigma_{foreachYt,Y_{pred}}(Ytlog10(Y_{pred}) + (1 - Yt)log10(1 - Y_{pred}))$

- for each epoch:
  - for each batch of data points in train: (keep batch size=1)
    - calculate the gradient of loss function w.r.t each weight in weight vector (write your code in def gradient_dw())

      $dw^{(t)} = x_n(y_n - \sigma((w^{(t)})^T x_n + b^t)) - \frac{\lambda}{N}w^{(t)})$

    - Calculate the gradient of the intercept (write your code in def gradient_db()) check this

      $db^{(t)} = y_n - \sigma((w^{(t)})^T x_n + b^t))$

    - Update weights and intercept (check the equation number 32 in the above mentioned pdf):
      $w^{(t+1)} \leftarrow w^{(t)} + \alpha(dw^{(t)})$

      $b^{(t+1)} \leftarrow b^{(t)} + \alpha(db^{(t)})$

  - calculate the log loss for train and test with the updated weights (you can check the python assignment 10th question)
  - And if you wish, you can compare the previous loss and the current loss, if it is not updating, then you can stop the training
  - append this loss in the list (this will be used to see how loss is changing for each epoch after the training is over)

Initialize weights

In [77]:
```
def initialize_weights(row_vector):
    ''' In this function, we will initialize our weights and bias'''
    #initialize the weights as 1d array consisting of all zeros similar to the dimensions of row_vector
    #you use zeros_like function to initialize zero, check this link https://docs.scipy.org/doc/numpy/reference
    #initialize bias to zero
    #w = np.zeros(row_vector.size)
    w = np.zeros_like(row_vector)
    b = 0
    return w,b
```

In [78]:
```
dim=X_train[0]
w,b = initialize_weights(dim)
print('w =',(w))
print('b =',str(b))
```

```
w = [0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0.]
b = 0
```

Grader function - 1

In [79]:
```
dim=X_train[0]
w,b = initialize_weights(dim)
def grader_weights(w,b):
  assert((len(w)==len(dim)) and b==0 and np.sum(w)==0.0)
  return True
grader_weights(w,b)
```

Out[79]:
```
True
```

Compute sigmoid

$sigmoid(z) = 1/(1 + exp(-z))$

In [135…
```
import math
def sigmoid(z):
    ''' In this function, we will return sigmoid of z'''
    # compute sigmoid(z) and return
    # OverflowError: math range error  // when used math.exp()
    #return 1 / (1 + math.exp(-z))
    try:
        return 1.0 / (1 + np.exp(-z))
    except:
        return 0
```

Grader function - 2

In [136…
```
def grader_sigmoid(z):
  val=sigmoid(z)
  assert(val==0.8807970779778823)
  return True
grader_sigmoid(2)
```

Out[136]:
```
True
```

Compute loss

$logloss = -1 * \frac{1}{n}\Sigma_{foreachYt,Y_{pred}}(Ytlog10(Y_{pred}) + (1 - Yt)log10(1 - Y_{pred}))$

In [82]:
```
import math
def logloss(y_true,y_pred):
    # you have been given two arrays y_true and y_pred and you have to calculate the logloss
    #while dealing with numpy arrays you can use vectorized operations for quicker calculations as compared to
    #https://www.pythonlikeyoumeanit.com/Module3_IntroducingNumpy/VectorizedOperations.html
    #https://www.geeksforgeeks.org/vectorized-operations-in-numpy/
    #write your code here

    # NOTE : Here Y_t (ie actual) is used so linear prediction will be regarded as signed distance
    #.       & this is true only for Trainning Phase

    # https://stackoverflow.com/questions/21752989/numpy-efficiently-avoid-0s-when-taking-logmatrix
    #apply_log = np.vectorize(lambda x: math.log10(x) if x else x)

    # log10(0) = 0, below for calculation purpose only !
    l1 = y_true * np.log10(y_pred, out=np.zeros_like(y_pred), where=(y_pred!=0))
    p0 = 1-y_pred
    l2 = (1-y_true) * np.log10(p0, out=np.zeros_like(p0), where=(p0!=0))

    loss = -1 * np.average(l1 + l2)
    return loss
```

In [83]:
```
# Alternative Way to Apply the Function to numpy array
```

```
# m = np.array([1,2,3,4,45,0,20,0])
# n = np.vectorize(lambda x: math.log10(x) if x else x)
# mn = n(m)
# mn
```

Grader function - 3

In [84]:
```
#round off the value to 8 values
def grader_logloss(true,pred):
  loss=logloss(true,pred)
  assert(np.round(loss,6)==0.076449)
  return True
true=np.array([1,1,0,1,0])
pred=np.array([0.9,0.8,0.1,0.8,0.2])
grader_logloss(true,pred)
```

Out[84]:
```
True
```

Compute gradient w.r.to 'w'

$$dw^{(t)} = x_n(y_n - \sigma((w^{(t)})^T x_n + b^t)) - \frac{\lambda}{N} w^{(t)}$$

In [85]:
```
#make sure that the sigmoid function returns a scalar value, you can use dot function operation
def gradient_dw(x,y,w,b,alpha,N):
    '''In this function, we will compute the gardient w.r.to w '''
    z = np.dot(w, x) + b  # signed_distance
    predict = sigmoid(z)  # Hypothesis
    loss = y - predict
    grad_dw = x * loss    # derivavtive for Loss term
    grad_lma = -alpha/N * w  # derivative for Regularizer term
    dw = grad_dw + grad_lma  # total derivative term
    return dw
```

Grader function - 4

In [86]:
```
def grader_dw(x,y,w,b,alpha,N):
  grad_dw=gradient_dw(x,y,w,b,alpha,N)
  assert(np.round(np.sum(grad_dw),5)==4.75684)
  return True
grad_x=np.array([-2.07864835,  3.31604252, -0.79104357, -3.87045546, -1.14783286,
       -2.81434437, -0.86771071, -0.04073287,  0.84827878,  1.99451725,
        3.67152472,  0.01451875,  2.01062888,  0.07373904, -5.54586092])
grad_y=0
grad_w=np.array([ 0.03364887,  0.03612727,  0.02786927,  0.08547455, -0.12870234,
       -0.02555288,  0.11858013,  0.13305576,  0.07310204,  0.15149245,
       -0.05708987, -0.064768  ,  0.18012332, -0.16880843, -0.27079877])
grad_b=0.5
alpha=0.0001
N=len(X_train)
grader_dw(grad_x,grad_y,grad_w,grad_b,alpha,N)
```

Out[86]:
```
True
```

Compute gradient w.r.to 'b' (ie Bias Term (Intercept term))

For Infomation :-

```
intercept term helps to move our best fit line move up or down based on data. Say all the data
is at y=100 and in x range [-10,10] and say we kept intercept=0 then best fit line moves
through origin and no where fits the data and we get high error. while if we let our
optimization choose intercept then it selects such that error is low.
```

$$db^{(t)} = y_n - \sigma((w^{(t)})^T x_n + b^t)$$

In [87]:
```
#sb should be a scalar value
def gradient_db(x,y,w,b):
    '''In this function, we will compute gradient w.r.to b '''
    z = np.dot(w, x) + b # distance
    db = y - sigmoid(z)
    return db
```

Grader function - 5

In [88]:
```
def grader_db(x,y,w,b):
  grad_db=gradient_db(x,y,w,b)
  assert(np.round(grad_db,4)==-0.3714)
  return True
grad_x=np.array([-2.07864835,  3.31604252, -0.79104357, -3.87045546, -1.14783286,
       -2.81434437, -0.86771071, -0.04073287,  0.84827878,  1.99451725,
        3.67152472,  0.01451875,  2.01062888,  0.07373904, -5.54586092])
grad_y=0.5
```

```
grad_b=0.1
grad_w=np.array([ 0.03364887,  0.03612727,  0.02786927,  0.08547455, -0.12870234,
       -0.02555288,  0.11858013,  0.13305576,  0.07310204,  0.15149245,
       -0.05708987, -0.064768  ,  0.18012332, -0.16880843, -0.27079877])
alpha=0.0001
N=len(X_train)
grader_db(grad_x,grad_y,grad_w,grad_b)
```

Out[88]:
```
True
```

In [101…
```
# prediction function used to compute predicted_y given the dataset X
def pred(w,b, X):
    N = len(X)
    predict = []
    for i in range(N):
        z=np.dot(w,X[i])+b   # distance (ie Linear Model)
        predict.append(sigmoid(z))
    return np.array(predict)
```

Implementing logistic regression

In [133…
```
def train(X_train,y_train,X_test,y_test,epochs,alpha,eta0,tol=1e-3):
    ''' In this function, we will implement logistic regression
        :param alpha: regularization param (Hyper-Param)
        :param eta0: learning rate (Hyper-Param)
        :param tol: tolerance for stopping training thresold
    '''
    #Here eta0 is learning rate
    #implement the code as follows
    # initalize the weights (call the initialize_weights(X_train[0]) function)
    # for every epoch
        # for every data point(X_train,y_train)
           #compute gradient w.r.to w (call the gradient_dw() function)
           #compute gradient w.r.to b (call the gradient_db() function)
           #update w, b
        # predict the output of x_train [for all data points in X_train] using pred function with updated weigh
        #compute the loss between predicted and actual values (call the loss function)
        # store all the train loss values in a list
        # predict the output of x_test [for all data points in X_test] using pred function with updated weights
        #compute the loss between predicted and actual values (call the loss function)
        # store all the test loss values in a list
        # you can also compare previous loss and current loss, if loss is not updating then stop the process
        # you have to return w,b , train_loss and test loss

    train_loss = []
    test_loss = []
    prev_tr_loss = float('inf')  # Used in Stopping Criterion
    w,b = initialize_weights(X_train[0]) # Initialize the weights
